UID LAB EXPERIMENT - 3A

KARTHAVYA S

Food Ordering App

1. Introduction

This document provides a detailed breakdown of the **Food Ordering App** prototype. The design focuses on a vibrant, food-centric user experience, allowing users to browse authentic Indian dishes, manage favorites, and navigate a categorized menu seamlessly.

2. Objective of the Design

- **Visual Appeal:** Use high-quality imagery of Indian cuisine to stimulate user appetite.
- **Streamlined Ordering:** Create a frictionless path from the Splash screen to the Menu.
- **Personalization:** Demonstrate how users can "Favorite" specific items (like Biryani or Idly) for quick access.
- **Clear Categorization:** Organize diverse food items into logical time-of-day categories (Breakfast, Meals, Snacks).

3. Overview of the Prototype

The prototype features a warm color palette (burnt orange and white) to evoke a sense of spice and freshness. It utilizes a standard bottom navigation bar for high-level movement and a tab-based system for menu filtering.

Key Characteristics:

- **Thematic UI:** Warm orange accents consistently used for buttons and active states.
- **Image-Driven Cards:** Large, rounded cards that highlight the food aesthetic.
- **Contextual Navigation:** Use of "Back" buttons and a persistent Shopping Cart icon.

4. Design Structure

4.1 Welcome & Onboarding (Splash Screen)

- **Visuals:** Features an artistic illustration of spoons and spices.
- **Action:** A prominent **"Get Started"** button serves as the primary entry point.
- **Bottom Graphic:** A high-resolution "Thali" image sets the culinary tone immediately.

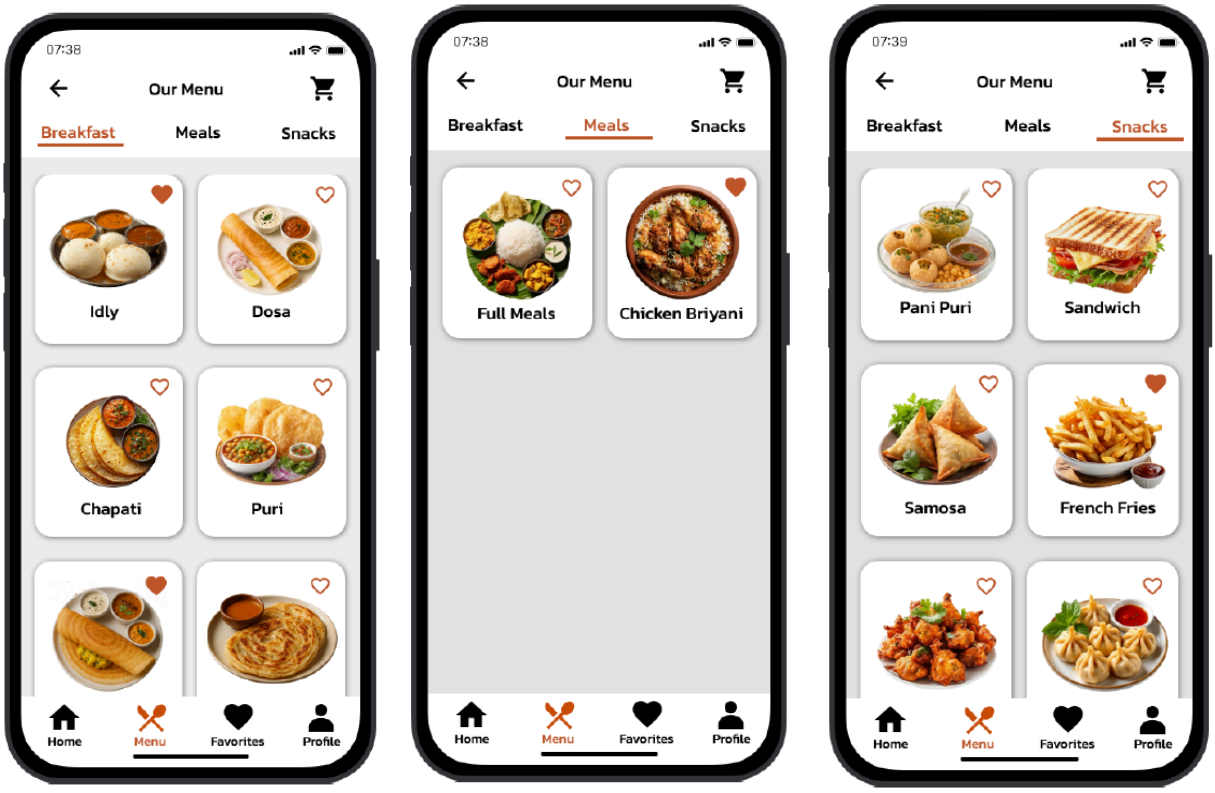
4.2 Home / Landing Screen

- **Greeting:** Personalized "We Welcomes You" header with a friendly Chef mascot.
- **Quick Action:** A secondary **"Click here to see the Menu"** button to drive user conversion.
- **Visual Depth:** Features a semi-transparent food background to maintain the theme without distracting from the text.

4.3 The "Our Menu" Experience

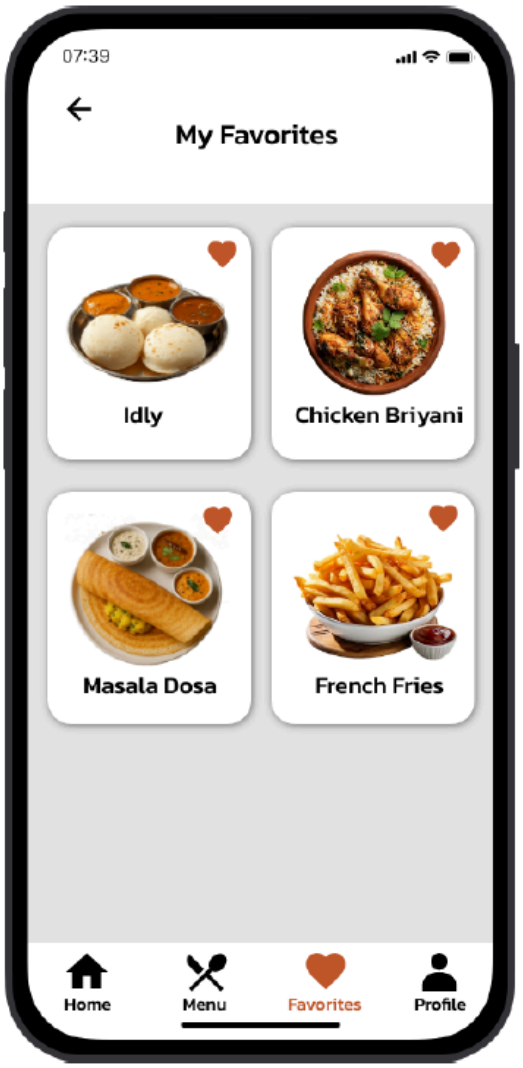
This section is split into three interactive tabs:

- **Breakfast:** Featuring South Indian staples like *Idly, Dosa, Chapati,* and *Puri*.
- **Meals:** Focused on heavier options like *Full Meals* and *Chicken Biryani*.
- **Snacks:** Highlighting popular street foods and appetizers like *Pani Puri, Samosa, Sandwich, French Fries,* and *Momos*.



4.4 My Favorites Screen

- Allows users to view a curated list of their liked items.
- In the prototype, items like *Chicken Biryani* and *Masala Dosa* are shown with "filled" heart icons to indicate the active favorite state.



5. UI/UX Design Principles

- **Visual Hierarchy:** Bold typography for dish names and subtle grey backgrounds for cards to create depth.
- **Feedback Loops:** Changing heart icon states (outlined vs. filled) provides immediate visual feedback.

- **Intuitive Layout:** The bottom navigation uses recognizable icons (Home, Fork/Spoon for Menu, Heart for Favorites, Person for Profile).

6. Tools and Technologies Used

- **Proto.io:** For high-fidelity prototyping and transition logic.
- **Custom Assets:** Transparent PNG food photography and themed vector illustrations.

7. Advantages of the Prototype

- **Stakeholder Alignment:** Clearly shows how the "Meals" vs. "Snacks" categories will look.
- **UX Validation:** Confirms that the bottom navigation is the most efficient way to switch between the Menu and Favorites.

8. Future Enhancements

- **Search Functionality:** Adding a search bar to the "Our Menu" screen.
- **Checkout Flow:** Designing the "Cart" and "Payment" screens.
- **Filter System:** Adding Veg/Non-Veg filters to the menu cards.

9. Conclusion

The **Food Ordering App** prototype successfully translates the richness of Indian cuisine into a clean, modern mobile interface. By focusing on high-quality visuals and a logical category structure, this design provides a solid blueprint for the upcoming development phase.
